

### Abstract

Methods and systems provide for aggregating person-centric data from one or more data sources and for providing the aggregated data to a user via a computer-  
5 displayed user interface that is keyed on or otherwise associated with an identified name in electronically presented text or data. A name in the text or data of an electronic document is identified and is associated with a unique identification, such as an electronic mail address. The unique identification is used by a persona menu application to obtain person-centric data from a variety of data sources. Example data sources include  
10 electronic mail contact files, electronic mail and calendaring system free/busy status files, directories of person-centric data related to persons associated with a distributed computing network, and instant messaging files. A data structure is populated with the returned data. Upon user selection, a user interface containing aggregated data associated with the identified name is displayed to the user to provide the user helpful information  
15 and actions associated with the identified name.
